

TBS-2

Trayloading system

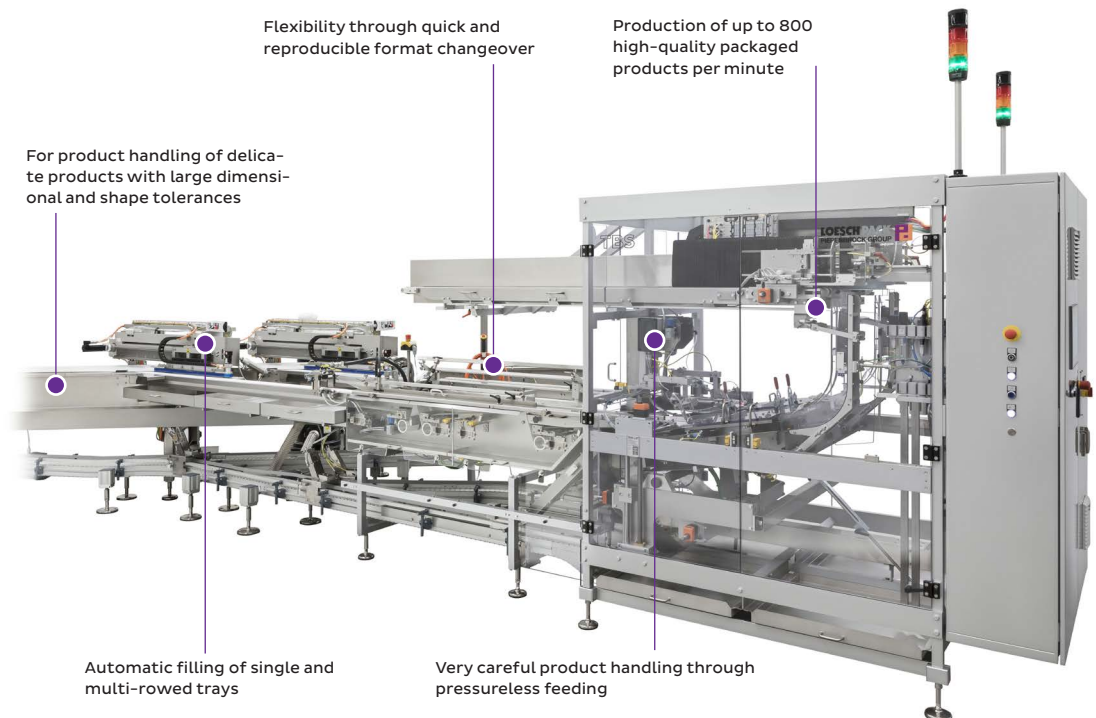

Fast and efficient packaging of baked goods

The TBS-2 is our system for fully automatic filling of single and multi-row trays. We use the machine primarily in the confectionery and dry baked goods industry for handling delicate products with large dimensional and shape differences. The TBS-2 packs cookies, sponge cakes, and chocolate products at a high speed of up to 800 products a minute. These can be arranged in the tray in any way, whether upright, flat, or shingled.

Efficiency, flexibility and performance

- > Modular designed machine layout adapted to the specific requirements of the confectionery and dry baked goods industry
- > Execution as single- or double module (TBS-2); however, each module is an independent system
- > High format flexibility
- > Very careful product handling through pressureless feeding and counting of the products without grippers or separating devices
- > Exact number of products at all times even with irregular production
- > Hygienic and space-saving design
- > Optimized accessibility for operation, maintenance and cleaning

Flexibility through quick and reproducible format changeover

Production of up to 800 high-quality packaged products per minute

For product handling of delicate products with large dimensional and shape tolerances

Automatic filling of single and multi-rowed trays

Very careful product handling through pressureless feeding
