

# LOMATIC

## Feeding and distribution system

### Efficient feeding and distribution of piece goods

The latest-generation LOMATIC is a modular feed and distribution system designed for all speed ranges. The fully automatic system is primarily used in the chocolate industry downstream of molding and enrobing lines, as well as in the biscuit, wafer and granola bar industry for controlled row-by-row feeding to downstream packaging machines. One or more LOMATIC stations are used, depending on the configuration of the packaging line. In continuous operation, up to 190 rows/min can be processed.

### Performance and efficiency

- > Hygienic design: Open design with optimum accessibility, minimum of machine feet, smooth surfaces for cleaning
- > Minimal downtime thanks to toolless belt change
- > Increased running accuracy and lifetime due to active electric tracking control on all longitudinal belts
- > No belt heating thanks to rolling knife edges
- > Energy-efficient design without pneumatic components
- > Easier operation and time savings thanks to an intelligent automatic start-up
- > Higher line efficiency due to optimal integration of buffer systems
- > Simulation of the packaging line with Plant Simulation
- > Ideally harmonized packaging systems from a single source – from the feeder to the display carton
